

We will mostly utilize the following topics:

- Vector and Matrix arithmetic: addition, subtraction, transposes
- Inner product of vectors, outer product of vectors
- Matrix multiplication (non-commutative!)
- Rank - the implications for a matrix being full-rank or not
- Matrix inverse - not how to calculate it by hand, but conditions needed to invert (square, full-rank) and the conditions for the inverse to be stable (low condition number, determinant not too small)

I highly recommend reading references "on-demand" as you hit specific issues where you have questions.

I do not recommend trying to go through a whole linear algebra textbook--even in areas we discuss, it will have much more than we need.

Still, here are a few textbook references if you would like. I do not rank any of these much higher than the others, and feel free to suggest others.

References

The linear algebra concepts above are standard--you can find many good references for them, including Wikipedia.
